

Java web development

Web application any software application whose services are accessed via the ~~web~~ web e.g - Udemmy, Google, Fb

E.g chrome, safari, firefox etc

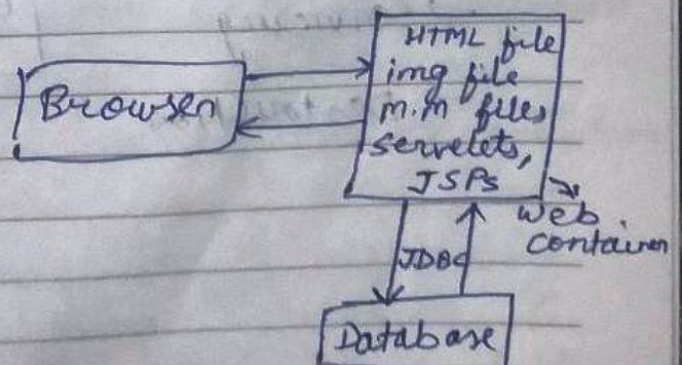

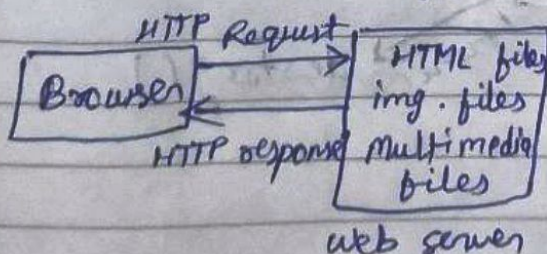

E.g Apache, IIS

URL - http : // www.udemy.com : 80
 protocol domainname Port no

Web application

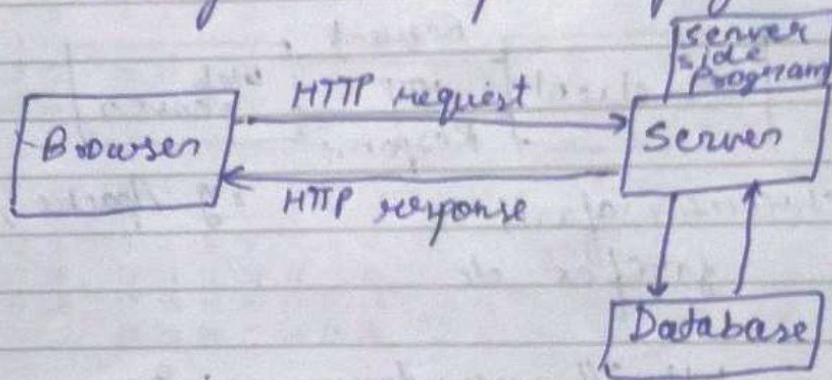

Static
(Non interactive web app)

Dynamic (interactive web app)

Server Side programming

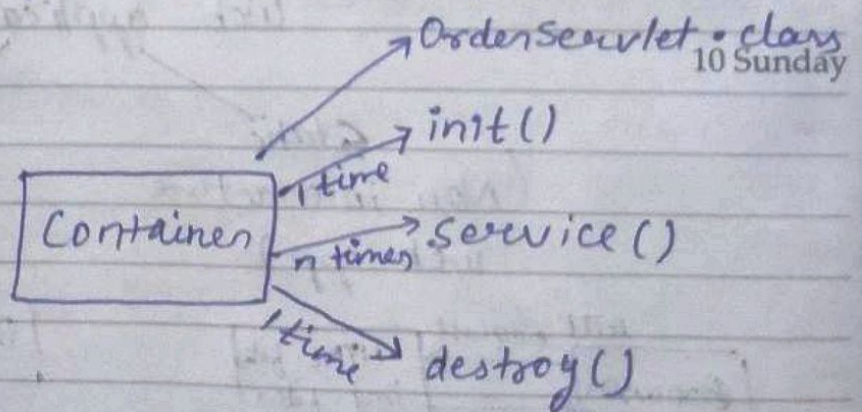

- Capturing the user i/p
- Communicate with the database
- Processing of data
- Produce the response page
- Handing the response page to the server

Servlet Life cycle method & phases

phases

- instantiation
- initialization
- servicing
- Destruction

Web-App folder Structure

WEBAPP

home.html
login.jsp

WEB-INF

├ web.xml
├ classes
└ lib

└ mysql.jar spring.jar hibernate.jar

Servlets - Technology in a java EE standard that allows us to develop dynamic web application in java

Servlet

- API - Application programmer interface
Dynamic web App
- Specification

→ Servlet on the other hand is a java program that runs on the server or the web container. It can perform following operation i.e. it can capture the request come from web browser, processes it & depending on request it perform operation & take response from database & send it back to web browser.

Servlet Annotation

@ WebServlet

@ WebInit Param

@ WebFilter

@ WebListener

JDBC Architecture It has 4 components

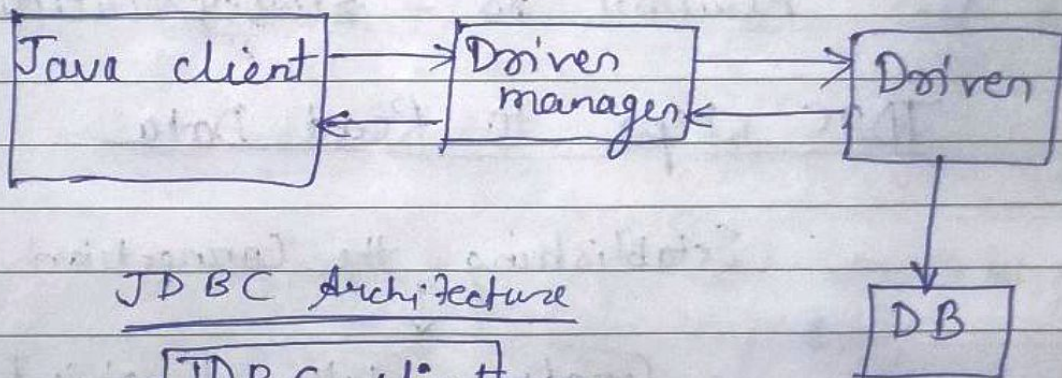

- 1.) JDBC client - Application code which we are developing
- 2.) JDBC API - is the standard API from Oracle
- 3.) JDBC Driver - is program which is ^{an} interface b/w our JDBC client & underlying database
- 4.) Driver Manager - is helper class which finds driver & establishes connection to database

Notes

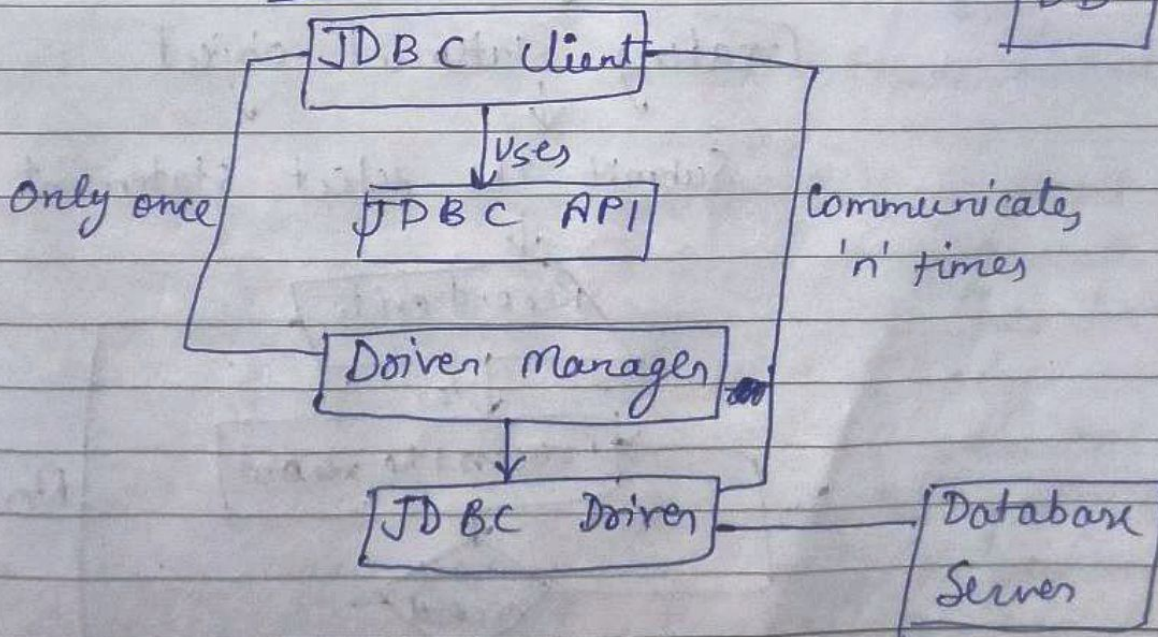

JDBC client → performs following

- 1.) Connects to database
- 2.) Perform CRUD (Create Read Update delete)
- 3.) Process the response
- 4.) Handle the ~~exp~~ exceptions
- 5.) Do transaction management
- 6.) Close the connection.

Driver Manager

JDBC Architecture

Steps to perform CRUD

- S-(i) Establish the connection
- S-(ii) Create the statement object
- S-(iii) Submit the SQL query to DBMS
- S-(iv) Close the statement
- S-(v) Close the connection

Statement interface

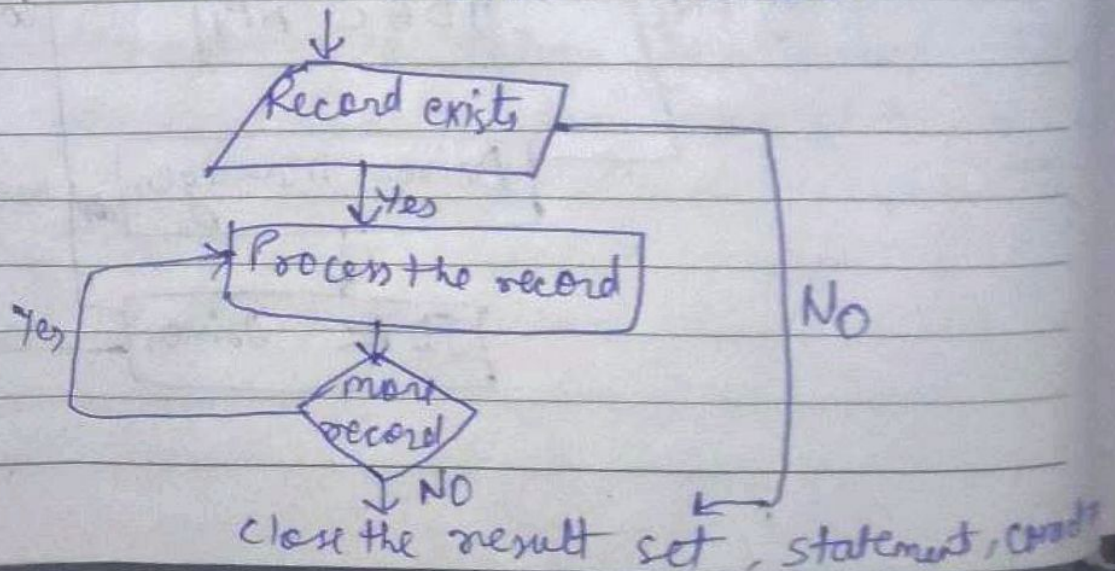

```
Statement stmt = con.createStatement();  
int result = stmt.executeUpdate("");  
ResultSet rs = stmt.executeQuery("");
```

JDBC steps to Read Data

Establishing the Connection

↓
Creating statement object

↓
Submit the select statement

ResultSet interface in JDBC API is use to handle the data that comes back when we execute a select query.

A result set is a object oriented representation of table of record retrieve from database.

Get & Post

Http protocol support several method using which a web client can access a server. two of popular methods are Get & post.

Get V/s Post

- Get is use by default

- Get is used in 3 cases

i) User specified URL

ii) User click on a hyperlink

iii) User submits the form

- It is meant for getting data

- It ~~only~~ only has header field & body doesn't have body

- All the data that we submit from browser goes as query string

- We shouldn't ^{use to} send sensitive data

- Post has to be mentioned explicitly

<form method="Post">

- It is meant for posting data

- It has both header & body

- The goes to server as the part of http body or payload.

- We can use this for sensitive data

→ The query string has restriction on length so we have restriction on amount of data that we sent using get method.

→ We can send any amount of data.

→ It is non idempotent.

→ Get is idempotent, means we can execute get any no. of times but it will not affect state of application.

Init Params are the name value pairs of textual information that can be passed to a servlet through the web.xml. You can configure the init params in the web.xml right where we declare the servlet.

17 Sunday

<servlet>

<servlet-name> . . .

<servlet-class> . . .

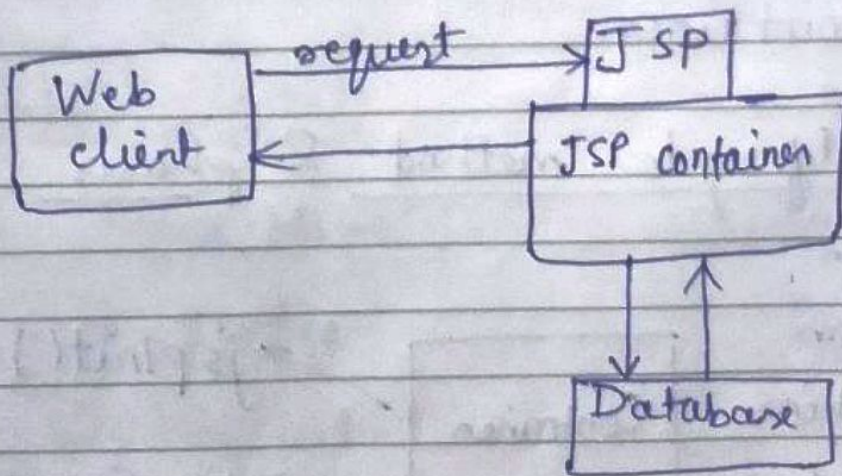

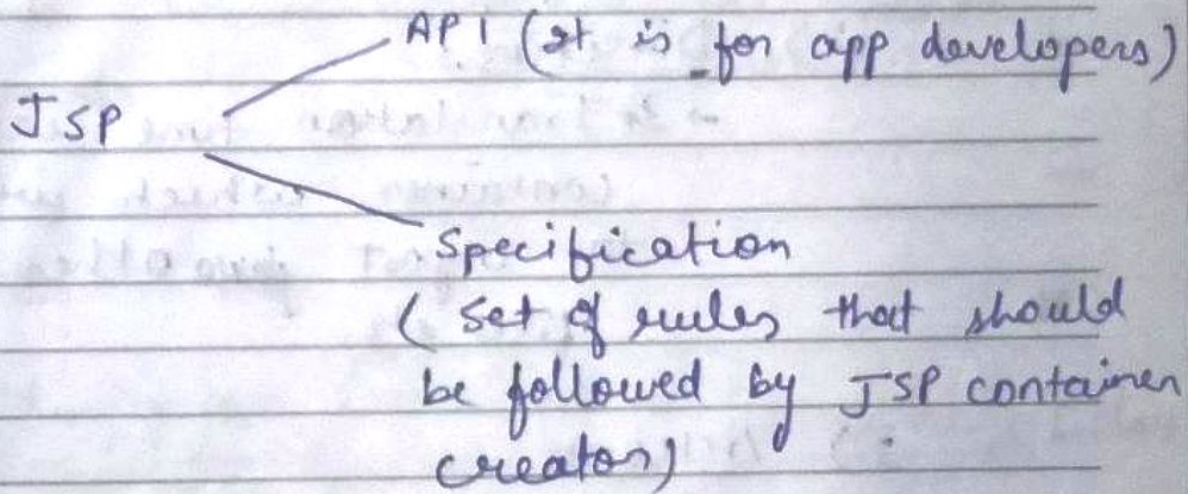

<init-param>

<param-name> db user </param-name>

<param-value> root </param-value>

</init-param>

JSP (Java Server Pages) is a tech in Java EE space that comes with API & specification.

→ It over come limitation of ~~the~~ Servlet

JSP Elements

1.) Scripting Elements

→ To embed java code in to a JSP Page

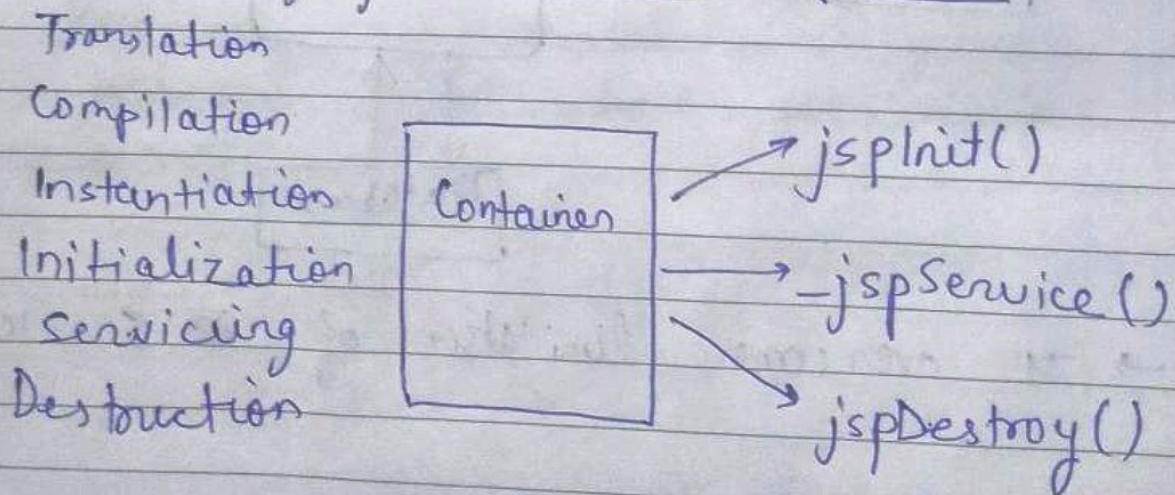

2.) Directives

→ Translation time instruction to the container which will allow us to import java other class lib, or files etc.

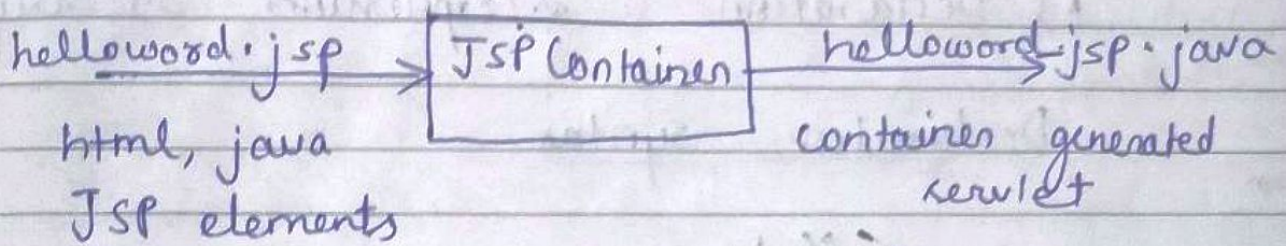

3.) Actions

Runtime instructions to the JSP container.

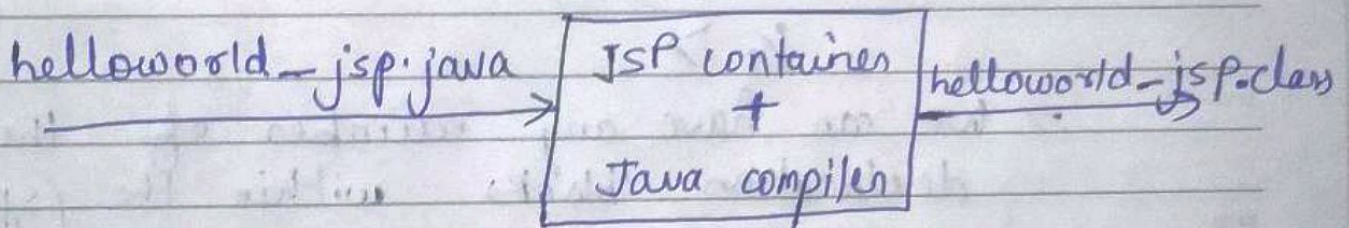

JSP lifecycle method & phases

Translation

Compilation

Implicit Objects

Object Name	Type
i) config	ServletConfig
ii) request	HttpServletRequest
iii) response	HttpServletResponse
iv) session	HttpSession
v) application	ServletContext
vi) page	java.lang.Object
vii) pageContext	javax.servlet.jsp.PageContext
viii) exception	java.lang.Throwable
ix) out	javax.servlet.jsp. JSPWriter

Scripting Elements

1.) Declaration

2.) Expression

3.) Scriptlet

Declaration syntax

<%!

} Any java code here

%>

→ We can have any number of these declaration blocks within the jsp page

Expression syntax

<%= %>

Any java expression that evaluates a value.

E.g

<%= user.getName() %>

Evaluates & send the response

Scriptlet

<%

} Any no. of java statements

%>

E.g

<%

```
String num1 = request.getParameter("num1");  
String num2 = request.getParameter("num2");  
int result = num1 + num2;  
%>
```
